Received and published: 9 December 2018

The author proposed three conclusions:

1. the DCB results can be improved by using weight function according elevation;
2. more stations used in DCB estimation can improve the results precision;
3. it is better using multi station network than single station.

However, the conclusions above are widely known across the community and thus not new.

Furthermore, I have the following specific remarks:

- The experiment data should be more in spatial and temporal resolution, which means the span of the data should be longer and the number of stations should be more.

C1
- Many abbreviations should be specified at the beginning of the manuscript where they first appear.
- The author should clearly point out the form of weighted function in the manuscript.
